ABSTRACTED-PUB-NO: JP 07173070A  
BASIC-ABSTRACT:

HIV virus activity inhibitor is prepd. by inoculating Lentinus edodes hypha onto bagasse solid medium and cultivating, dissociating the solid medium contg. proliferated hyphae, adding cellulase or protease to the medium at 30 to 50 degree C, extracting the hyphae in presence of the enzyme, inactivating the enzyme and sterilisation by heating to 95 deg. C.

USE/ADVANTAGE - The drug is used for treatment of HIV infections. The drug inhibits HIV proliferation and is highly safe. The drug at 125 microgram /ml inhibits the proliferation of HIV inoculated on MT-4 cells.

In an example, Lentinus edodes was inoculated onto the wetted solid medium composing 90 pts.wt. of bagasse and 10 pts.wt. of rice bran, and cultivated. After the hyphae were proliferated, the bagasse fibres were dissociated by sieving. Then, 3.5 l pure water and 2.0 g cellulase were added to the medium (1.0 kg) at 40 degree C. The bagasse containing medium was circulated and ground using pump with speed change gear so that 80 wt.% of bagasse fibres were sieved through 12 mesh screen, heated to 90 degree C, left for 30 minutes, and filtrated through 60-mesh filter to give Lentinus edodes hypha extract.
